Perhaps Freud's single most enduring and important idea was that the human psyche (personality) has more than one aspect.

Freud's personality theory (1923) saw the psyche structured into three parts (i.e., tripartite), the id, ego and superego, all developing at different stages in our lives. These are systems, not parts of the brain, or in any way physical.

According to Freud's model of the psyche, the id is the primitive and instinctual part of the mind that contains sexual and aggressive drives and hidden memories, the super-ego operates as a moral conscience, and the ego is the realistic part that mediates between the desires of the id and the super-ego.
Although each part of the personality comprises unique features, they interact to form a whole, and each part makes a relative contribution to an individual's behavior.

What is the id?

The id is the primitive and instinctive component of personality. It consists of all the inherited (i.e., biological) components of personality present at birth, including the sex (life) instinct – Eros (which contains the libido), and the aggressive (death) instinct - Thanatos.

The id is the impulsive (and unconscious) part of our psyche which responds directly and immediately to basic urges, needs, and desires. The personality of the newborn child is all id and only later does it develop an ego and super-ego.
The id remains infantile in its function throughout a person’s life and does not change with time or experience, as it is not in touch with the external world. The id is not affected by reality, logic or the everyday world, as it operates within the unconscious part of the mind.
The id operates on the pleasure principle (Freud, 1920) which is the idea that every wishful impulse should be satisfied immediately, regardless of the consequences. When the id achieves its demands, we experience pleasure when it is denied we experience ‘unpleasure’ or tension.

The id engages in primary process thinking, which is primitive, illogical, irrational, and fantasy oriented. This form of process thinking has no comprehension of objective reality, and is selfish and wishful in nature.

What is the ego?

The ego is 'that part of the id which has been modified by the direct influence of the external world.'

(Freud, 1923, p. 25)

The ego develops to mediate between the unrealistic id and the external real world. It is the decision-making component of personality. Ideally, the ego works by reason, whereas the id is chaotic and unreasonable.

The ego operates according to the reality principle, working out realistic ways of satisfying the id’s demands, often compromising or postponing satisfaction to avoid negative consequences of society. The ego considers social realities and norms, etiquette and rules in deciding how to behave.

Like the id, the ego seeks pleasure (i.e., tension reduction) and avoids pain, but unlike the id, the ego is concerned with devising a realistic strategy to obtain pleasure. The ego has no concept of right or wrong; something is good simply if it achieves its end of satisfying without causing harm to itself or the id.
Often the ego is weak relative to the headstrong id, and the best the ego can do is stay on, pointing the id in the right direction and claiming some credit at the end as if the action were its own.

Freud made the analogy of the id being a horse while the ego is the rider. The ego is 'like a man on horseback, who has to hold in check the superior strength of the horse.'

(Freiud, 1923, p. 15)

If the ego fails in its attempt to use the reality principle, and anxiety is experienced, unconscious defense mechanisms are employed, to help ward off unpleasant feelings (i.e., anxiety) or make good things feel better for the individual.

The ego engages in secondary process thinking, which is rational, realistic, and orientated towards problem-solving. If a plan of action does not work, then it
is thought through again until a solution is found. This is known as reality testing and enables the person to control their impulses and demonstrate self-control, via mastery of the ego.

An important feature of clinical and social work is to enhance ego functioning and help the client test reality through assisting the client to think through their options.

What is the superego?

The superego incorporates the values and morals of society which are learned from one's parents and others. It develops around the age of 3 – 5 years during the phallic stage of psychosexual development.

The superego's function is to control the id's impulses, especially those which society forbids, such as sex and aggression. It also has the function of persuading the ego to turn to moralistic goals rather than simply realistic ones and to strive for perfection.

The superego consists of two systems: The conscience and the ideal self. The conscience can punish the ego through causing feelings of guilt. For example, if the ego gives in to the id's demands, the superego may make the person feel bad through guilt.

The ideal self (or ego-ideal) is an imaginary picture of how you ought to be, and represents career aspirations, how to treat other people, and how to behave as a member of society.
Behavior which falls short of the ideal self may be punished by the superego through guilt. The super-ego can also reward us through the ideal self when we behave ‘properly’ by making us feel proud.

If a person’s ideal self is too high a standard, then whatever the person does will represent failure. The ideal self and conscience are largely determined in childhood from parental values and how you were brought up.
